## 19 — Abstract —

---

20 A generalization of classical cycle hitting problems, called conflict version of the problem, is  
21 defined as follows. An input is undirected graphs  $G$  and  $H$  on the same vertex set, and a positive  
22 integer  $k$ , and the objective is to decide whether there exists a vertex subset  $X \subseteq V(G)$  such  
23 that it intersects all desired “cycles” (all cycles or all odd cycles or all even cycles) and  $X$  is an  
24 independent set in  $H$ . In this paper we study the conflict version of classical FEEDBACK VERTEX  
25 SET, and ODD CYCLE TRANSVERSAL problems, from the view point of kernelization complexity.  
26 In particular, we obtain the following results, when the conflict graph  $H$  belongs to the family  
27 of  $d$ -degenerate graphs.

- 28 1. CF-FVS admits a  $\mathcal{O}(k^{\mathcal{O}(d)})$  kernel.
- 29 2. CF-OCT does not admit polynomial kernel (even when  $H$  is 1-degenerate), unless  $\text{NP} \subseteq \frac{\text{coNP}}{\text{poly}}$ .

30 For our kernelization algorithm we exploit ideas developed for designing polynomial kernels for  
31 the classical FEEDBACK VERTEX SET problem, as well as, devise new reduction rules that exploit  
32 degeneracy crucially. Our main conceptual contribution here is the notion of “ $k$ -independence  
33 preserver”. Informally, it is a set of “important” vertices for a given subset  $X \subseteq V(H)$ , that  
34 is enough to capture the independent set property in  $H$ . We show that for  $d$ -degenerate graph  
35 independence preserver of size  $k^{\mathcal{O}(d)}$  exists, and can be used in designing polynomial kernel.

44 **1 Introduction**

45 Reducing the input data, in polynomial time, without altering the answer is one of the  
 46 popular ways in dealing with intractable problems in practice. While such polynomial  
 47 time heuristics can not solve NP-hard problems exactly, they work well on input instances  
 48 arising in real-life. It is a challenging task to assess the effectiveness of such heuristics  
 49 theoretically. Parameterized complexity, via kernelization, provides a natural way to quantify  
 50 the performance of such algorithms. In parameterized complexity each problem instance  
 51 comes with a parameter  $k$  and the parameterized problem is said to admit a *polynomial*  
 52 *kernel* if there is a polynomial time algorithm, called a *kernelization* algorithm, that reduces  
 53 the input instance down to an instance with size bounded by a polynomial  $p(k)$  in  $k$ , while  
 54 preserving the answer. The reduced instance is called a  $p(k)$  kernel for the problem.

55 The quest for designing polynomial kernels for “hitting cycles” in undirected graphs has  
 56 played significant role in advancing the field of polynomial time pre-processing – kernelization.  
 57 Hitting all cycles, odd cycles and even cycles correspond to well studied problems of FEEDBACK  
 58 VERTEX SET (FVS), ODD CYCLE TRANSVERSAL (OCT) and EVEN CYCLE TRANSVERSAL  
 59 (ECT), respectively. Alternatively, FVS, OCT and ECT correspond to deleting vertices such  
 60 that the resulting graph is a forest, a bipartite graph and an odd cactus graph, respectively.  
 61 All these problems, FVS, OCT, and ECT, have been extensively studied in parameterized  
 62 algorithms and kernelization. The earliest known FPT algorithms for FVS go back to the  
 63 late 80’s and the early 90’s [4, 11] and used the seminal Graph Minor Theory of Robertson  
 64 and Seymour. On the other hand the parameterized complexity of OCT was open for long  
 65 time. Only, in 2003, Reed et al. [24] gave a  $3^k n^{\mathcal{O}(1)}$  time algorithm for OCT. This is also  
 66 the paper which introduced the *method of iterative compression* to the field of parameterized  
 67 complexity. However, the existence of polynomial kernel, for FVS and OCT were open  
 68 questions for long time. For FVS, Burrage et al. [7] resolved the question in the affirmative  
 69 by designing a kernel of size  $\mathcal{O}(k^{11})$ . Later, Bodlaender [5] reduced the kernel size to  $\mathcal{O}(k^3)$ ,  
 70 and finally Thomassé [25] designed a kernel of size  $\mathcal{O}(k^2)$ . The kernel of Thomassé [25] is  
 71 best possible under a well known complexity theory hypothesis. It is important to emphasize  
 72 that [25] popularized the method of *expansion lemma*, one of the most prominent approach  
 73 in designing polynomial kernels. While, the kernelization complexity of FVS was settled  
 74 in 2006, it took another 6 years and a completely new methodology to design polynomial  
 75 kernel for OCT. Kratsch and Wahlström [16] resolved the question of existence of polynomial  
 76 kernel for OCT by designing a randomized kernel of size  $\mathcal{O}(k^{4.5})$  using matroid theory.<sup>1</sup> As  
 77 a counterpart to OCT, Misra et al. [20] studied ECT and designed an  $\mathcal{O}(k^3)$  kernel.

78 Fruitful and productive research on FVS and OCT have led to the study of several  
 79 variants and generalizations of FVS and OCT. Some of these admit polynomial kernels  
 80 and for some one can show that none can exist, unless some unlikely collapse happens in  
 81 complexity theory. In this paper we study the following generalization of FVS, and OCT,  
 82 from the view-point of kernelization complexity.

CONFLICT FREE FEEDBACK VERTEX SET (CF-FVS)

**Parameter:**  $k$

**Input:** An undirected graph  $G$ , a conflict graph  $H$  on vertex set  $V(G)$  and a non-negative  
 83 integer  $k$ .

**Question:** Does there exist  $S \subseteq V(G)$ , such that  $|S| \leq k$ ,  $G - S$  is a forest and  $H[S]$  is  
 edgeless?

<sup>1</sup> This foundational paper has been awarded the Nerode Prize for 2018.

84 One can similarly define CONFLICT FREE ODD CYCLE TRANSVERSAL (CF-OCT).

85 **Motivation.** On the outset, a natural thought is “*why does one care*” about such an  
 86 esoteric (or obscure) problem. We thought *exactly the same* in the beginning, till we realized  
 87 the modeling power the problem provides and the rich set of questions one can ask. In the  
 88 course of this paragraph we will try to explain this. First observe that, if one wants to model  
 89 “independent” version of these problems (where the solution is suppose to be an independent  
 90 set), then one takes conflict graph to be same as the input graph. An astute reader will figure  
 91 out that the problem as stated above is  $W[1]$ -hard – a simple reduction from MULTICOLOR  
 92 INDEPENDENT SET with each color class being modeled as cycle and the conflict graph  
 93 being the input graph. Thus, a natural question is: *when does the problem become FPT?* To  
 94 state the question formally, let  $\mathcal{F}$  and  $\mathcal{G}$  be two families of graphs. Then,  $(\mathcal{G}, \mathcal{F})$ -CF-FVS is  
 95 same problem as CF-FVS, but the input graph  $G$  and the conflict graph  $H$  are restricted  
 96 to belong to  $\mathcal{G}$  and  $\mathcal{H}$ , respectively. It immediately brings several questions: (a) for which  
 97 pairs of families the problem is FPT; (b) can we obtain some kind of dichotomy results; and  
 98 (c) what could we say about the kernelization complexity of the problem. We believe that  
 99 answering these questions for basic problems such as FVS, OCT, and DOMINATING SET  
 100 will extend both the tractability as well as intractability tools in parameterized complexity  
 101 and led to some fruitful and rewarding research. It is worth to note that initially we were  
 102 inspired to define these problems by similar problems in computational geometry. See related  
 103 results for more on this.

104 **Our Results and Methods.** A graph  $G$  is called  $d$ -degenerate if every subgraph of  $G$   
 105 has a vertex of degree at most  $d$ . For a fixed positive integer  $d$ , let  $\mathcal{D}_d$  denote the set of  
 106 graphs of degeneracy at most  $d$ . In this paper we study the  $(\star, \mathcal{D}_d)$ -CF-FVS ( $\mathcal{D}_d$ -CF-FVS)  
 107 problem. The symbol  $\star$  denotes that the input graph  $G$  is arbitrary. One can similarly  
 108 define  $\mathcal{D}_d$ -CF-OCT. In fact, we study, CF-OCT for a very restricted family of conflict  
 109 graphs, a family of disjoint union of paths of length at most three and at most two star  
 110 graphs. We denote this family as  $\mathcal{P}_{\leq 3}^{\star\star}$  and this variant of CF-OCT as  $\mathcal{P}_{\leq 3}^{\star\star}$ -CF-OCT.  
 111 Starting point of our research is the recent study of Jain et al. [14], who studied conflict-free  
 112 graph modification problems in the realm of parameterized complexity. As a part of their  
 113 study they gave FPT algorithms for  $\mathcal{D}_d$ -CF-FVS,  $\mathcal{D}_d$ -CF-OCT and  $\mathcal{D}_d$ -CF-ECT using the  
 114 independence covering families [17]. Their results also imply similar FPT algorithm when the  
 115 conflict graph belongs to nowhere dense graphs. In this paper we focus on the kernelization  
 116 complexity of  $\mathcal{D}_d$ -CF-FVS, and  $\mathcal{P}_{\leq 3}^{\star\star}$ -CF-OCT obtain the following results.

- 117 1.  $\mathcal{D}_d$ -CF-FVS admits a  $\mathcal{O}(k^{\mathcal{O}(d)})$  kernel.
- 118 2.  $\mathcal{P}_{\leq 3}^{\star\star}$ -CF-OCT does not admit polynomial kernel, unless  $\text{NP} \subseteq \frac{\text{coNP}}{\text{poly}}$ .

119 Note that  $\mathcal{D}_0$  denotes edgeless graphs and hence  $\mathcal{D}_0$ -CF-FVS, and  $\mathcal{D}_0$ -CF-OCT are  
 120 essentially FVS, and OCT, respectively. Thus, any polynomial kernel for  $\mathcal{D}_d$ -CF-FVS, and  
 121  $\mathcal{P}_{\leq 3}^{\star\star}$ -CF-OCT, must generalize the known kernels for these problems. We remark that the  
 122 above result imply that CF-FVS admits polynomial kernels, when the conflict graph belong  
 123 to several well studied graph families, such as planar graphs, graphs of bounded degree, graphs  
 124 of bounded treewidth, graphs excluding some fixed graph as a minor, a topological minor  
 125 and graphs of bounded expansion etc. (all these graphs classes have bounded degeneracy).

126 **Strategy for CF-FVS.** Our kernelization algorithm for CF-FVS consists of the following  
 127 two steps. The first step of our kernelization algorithm is a structural decomposition of the  
 128 input graph  $G$ . This does not depend on the conflict graph  $H$ . In this phase of the algorithm,  
 129 given an instance  $(G, H, k)$  of CF-FVS we obtain an equivalent instance  $(G', H', k')$  of  
 130 CF-FVS such that:

- 131 ■ The minimum degree of  $G'$  is at least 2.  
 132 ■ The number of vertices of degree at least 3 in  $G'$  is upper bounded by  $\mathcal{O}(k^3)$ . Let  $V_{\geq 3}$   
 133 denote the set of vertices of degree at least 3 in  $G'$ .  
 134 ■ The number of maximal degree 2 paths in  $G'$  is upper bounded by  $\mathcal{O}(k^3)$ . That is,  
 135  $G' - V_{\geq 3}$  consists of  $\mathcal{O}(k^3)$  connected components where each component is a path.

136 We obtain this structural decomposition using reduction rules inspired by the quadratic  
 137 kernel for FVS [25]. As stated earlier, this step can be performed for any graph  $H$ . Thus the  
 138 problem reduces to designing reduction rules that bound the number of vertices of degree 2  
 139 in the reduced graph. Note that we can not do this for any arbitrary graph  $H$  as the problem  
 140 is W[1]-hard. Once the decomposition is obtained we can not use the known *reduction rules*  
 141 for FVS. This is for a simple reason that in  $G'$  the only vertices that are not bounded have  
 142 degree exactly 2 in  $G'$ . On the other hand for FVS we can do simple “short-circuit” of degree  
 143 2 vertices (remove the vertex and add an edge between its two neighbors) and assume that  
 144 there is no vertices of degree two in the graph. So our actual contributions start here.

145 The second step of our kernelization algorithm bounds the degree two vertices in the  
 146 graph  $G'$ . Here we must use the properties of the graph  $H$ . We propose new reduction  
 147 rules for bounding degree two vertices, when  $H$  belongs to the family of  $d$ -degenerate graphs.  
 148 Towards this we use the notion of  $d$ -degeneracy sequence, which is an ordering of the vertices  
 149 in  $H$  such that any vertex can have at most  $d$  forward neighbors. This is used in designing a  
 150 marking scheme for the degree two vertices. Broadly speaking our marking scheme associates  
 151 a set with every vertex  $v$ . Here, set consists of “paths and cycles of  $G'$  on which the forward  
 152 neighbors of  $v$  are”. Two vertices are called similar if their associated sets are same. We  
 153 show that if some vertex is not marked then we can safely contract this vertex to one of its  
 154 neighbors. We then upper bound the degree two vertices by  $\mathcal{O}(k^{\mathcal{O}(d)}d^{\mathcal{O}(d)})$ , and thus obtain  
 155 a kernel of this size for  $\mathcal{D}_d$ -CF-FVS.

156 At the heart of our kernelization algorithm is a combinatorial tool of “ $k$ -independence  
 157 preserver”. Informally, it is a set of “important” vertices for a given subset  $X \subseteq V(H)$ , that  
 158 is enough to capture the independent set property in  $H$ . We show that for  $d$ -degenerate  
 159 graph independence preserver of size  $k^{\mathcal{O}(d)}$  exists, and can be used in designing polynomial  
 160 kernel. This is our main conceptual contribution.

161 **Strategy for CF-OCT.** The kernelization lower bound is obtained by the method of  
 162 cross-composition [6]. We first define a conflict version of the  $s$ - $t$ -CUT problem, where  $H$   
 163 belongs to  $\mathcal{P}_{\leq 3}^{**}$ . Then, we show that the problem is NP-hard and cross composes to itself.  
 164 Finally, we give a parameter preserving reduction from the problem to  $\mathcal{P}_{\leq 3}^{**}$ -CF-OCT, and  
 165 obtain the desired kernel lower bound.

166 **Related Work.** In the past, the conflict free versions of some classical problems have  
 167 been studied, e.g. for SHORTEST PATH [15], MAXIMUM FLOW [21, 22], KNAPSACK [23], BIN  
 168 PACKING [12], SCHEDULING [13], MAXIMUM MATCHING and MINIMUM WEIGHT SPANNING  
 169 TREE [10, 9]. It is interesting to note that some of these problems are NP-hard even when  
 170 their non-conflicting version is polynomial time solvable. The study of conflict free problems  
 171 has also been recently initiated in computational geometry motivated by various applications  
 172 (see [1, 2, 3]).

## 173 2 Preliminaries

174 Throughout the paper, we follow the following notions. Let  $G$  be a graph,  $V(G)$  and  $E(G)$   
 175 denote the vertex set and the edge set of graph  $G$ , respectively. Let  $n$  and  $m$  denote the  
 176 number of vertices and the number of edges of  $G$ , respectively. Let  $G$  be a graph and  
 177  $X \subseteq V(G)$ , then  $G[X]$  is the graph induced on  $X$  and  $G - X$  is graph  $G$  induced on  $V(G) \setminus X$ .

178 Let  $\Delta$  denotes the maximum degree of graph  $G$ . We use  $N_G(v)$  to denote the neighborhood  
 179 of  $v$  in  $G$  and  $N_G[v]$  to denote  $N_G(v) \cup \{v\}$ . Let  $E'$  be subset of edges of graph  $G$ , by  $G[E']$   
 180 we mean the graph with the vertex set  $V(G)$  and the edge set  $E'$ . Let  $X \subseteq E(G)$ , then  
 181  $G - X$  is a graph with the vertex set  $V(G)$  and the edge set  $E(G) \setminus X$ . Let  $Y$  be a set of  
 182 edges on vertex set  $V(G)$ , then  $G \cup Y$  is graph with the vertex set  $V(G)$  and the edge set  
 183  $E(G) \cup Y$ . Degree of a vertex  $v$  in graph  $G$  is denoted by  $\deg_G(v)$ . For an integer  $\ell$ , we  
 184 denote the set  $\{1, 2, \dots, \ell\}$  by  $[\ell]$ . A *path*  $P = \{v_1, \dots, v_n\}$  is an ordered collection of vertices  
 185 such that there is an edge between every consecutive vertices in  $P$  and  $v_1, v_n$  are *endpoints* of  
 186  $P$ . For a path  $P$  by  $V(P)$  we denote set of vertices in  $P$  and by  $E(P)$  we denote set of edges  
 187 in  $P$ . A *cycle*  $C = \{v_1, \dots, v_n\}$  is a path with an edge  $v_1v_n$ . We define a *maximal degree two*  
 188 *induced path in  $G$*  as an induced path of maximal length such that all vertices in path are of  
 189 *degree exactly two in  $G$* . An *isolated cycle* in graph  $G$  is defined as an induced cycle whose  
 190 all the vertices are of degree exactly two in  $G$ . Let  $G'$  and  $G$  be graphs,  $V(G') \subseteq V(G)$  and  
 191  $E(G') \subseteq E(G)$ , then we say that  $G'$  is a *subgraph* of  $G$ . The subscript in the notations will  
 192 be omitted if it is clear from the context.

193 A graph  $G$  has *degeneracy  $d$*  if every subgraph of  $G$  has a vertex of degree at most  $d$ . An  
 194 ordering of vertices  $\sigma : V(G) \rightarrow \{1, \dots, n\}$  is called a  *$d$ -degeneracy sequence* of graph  $G$ , if  
 195 every vertex  $v$  has at most  $d$  neighbors  $u$  with  $\sigma(u) > \sigma(v)$ . A graph  $G$  is  *$d$ -degenerate* if and  
 196 only if it has a  *$d$ -degeneracy sequence*. For a vertex  $v$  in  *$d$ -degenerate graph  $G$* , the neighbors  
 197 of  $v$  which comes *after (before)*  $v$  in  *$d$ -degeneracy sequence* are called *forward (backward)*  
 198 *neighbors* of  $v$  in the graph  $G$ . Given a  *$d$ -degenerate graph*, we can find  *$d$ -degeneracy sequence*  
 199 in linear time [18].

### 200 **3 A Tool for Our Kernelization Algorithm**

201 In this section, we give a tool, which we believe might be useful in obtaining kernelization  
 202 algorithm for “conflict free” versions of various parameterized problems (admitting kernels),  
 203 when the conflict graph belongs to the family of  *$d$ -degenerate graphs*. We particularly use  
 204 this tool to obtain kernel for  $\mathcal{D}_d$ -CF-FVS (Section 4). For a parameterized problem  $\Pi$ ,  
 205 consider an instance  $(G, H, k)$  of its conflict free variant, CONFLICT FREE  $\Pi$ . Then in the  
 206 kernelization step where we want to bound the number of vertices, it is seemingly useful to  
 207 be able to obtain a set of “important” vertices for a given subset  $X \subseteq V(H)$  that will be  
 208 enough to capture the independent set property in  $H$ . The above intuition becomes clear  
 209 when we describe the kernelization algorithm for  $\mathcal{D}_d$ -CF-FVS.

210 To formalize the notion of “important” set of vertices, we give the following definition.

211 **► Definition 1.** For a  *$d$ -degenerate graph  $H$*  and a set  $X \subseteq V(H)$ , a  *$k$ -independence preserver*  
 212 for  $(H, X)$  is a set  $X' \subseteq X$ , such that for any independent set  $S$  in  $H$  of size at most  $k$ , if  
 213 there is  $v \in (S \cap X) \setminus X'$ , then there is  $v' \in X' \setminus S$ , such that  $(S \setminus \{v\}) \cup \{v'\}$  is an independent  
 214 set in  $H$ .

215 Throughout this section, we work with a (fixed)  $d$ , which is the degeneracy of the input  
 216 graph. The goal of this section will be to obtain an algorithm for computing a  *$k$ -independence*  
 217 *preserver* for  $(H, X)$  of “small” size. To quantify the “small” size, we need the following  
 218 definition.

219 **► Definition 2.** For each  $q \in [d]$ , we define an integer  $n_q$  as follows.

- 220 1. If  $q = 1$ , then  $n_q = kd + k + 1$ , and
- 221 2.  $n_q = kn_{q-1} + kd + k + 1$ , otherwise.

222 Next, we formally define the problem for which we want to design a polynomial time  
 223 algorithm. We call this problem  *$d$ -BOUNDED INDEPENDENCE PRESERVER* ( *$d$ -BIP*, for short).

$d$ -BOUNDED INDEPENDENCE PRESERVER ( $d$ -BIP)

**Input:** A  $d$ -degenerate graph  $H$ , a set  $X \subseteq V(H)$ , and an integer  $k$ .

**Output:** A set  $X' \subseteq X$  of size at most  $n_{d+1}$ , such that  $X'$  is a  $k$  independence preserver for  $(H, X)$ .

In the following, let  $(H, X, k)$  be an instance of  $d$ -BIP. We work with a (fixed)  $d$ -degeneracy sequence,  $\sigma$  of  $H$ . We recall that such a sequence can be computed in polynomial time [18]. Forward and backward neighbors of a vertex  $v$  are also defined with respect to the ordering  $\sigma$ . If  $\sigma(u) < \sigma(v)$ , then  $u$  is a backward neighbor of  $v$  and  $v$  is a forward neighbor of  $u$ . By  $N_H^f(v)$  ( $N_H^b(v)$ ) we denote the set of forward (backward) neighbors of the vertex  $v$  in  $H$ .

To design our polynomial time algorithm for  $d$ -BIP, we need the notion of  $q$ -reducible sets, which is formally defined below.

► **Definition 3.** A set  $Y \subseteq V(H)$  is  $q$ -reducible, if for every set  $U \subseteq Y$ , for which there is a set  $Z \subseteq V(H)$ , such that: (i)  $Z$  is of size exactly  $d - q + 1$  and (ii) for each  $u \in U$ , we have  $Z \subseteq N_H^f(u)$ , it holds that  $|U| \leq n_q$ .

Now, we give our polynomial time algorithm for  $d$ -BIP in Algorithm 1.

---

**Algorithm 1** Algo1( $H, X$ )

---

**Require:**  $d$ -degenerate graph  $H$ ,  $X \subseteq V(H)$ , and an integer  $k$ .

**Ensure:**  $X' \subseteq X$  of size at most  $n_{d+1}$ , which is a  $k$ -independence preserver of  $(H, X)$ .

```

1: For  $q \in [d]$ , set  $n_q = kd + 1$ , when  $q = 1$ , and  $n_q = kn_{q-1} + kd + k + 1$ , otherwise.
2:  $q = 1$ .
3: while  $q \leq d$  do
4:   while  $X$  is not  $q$ -reducible do
5:     Find  $U \subseteq X$  of size  $n_q + 1$ , for which there is  $Z \subseteq V(H)$  of size exactly  $d - q + 1$ ,
     such that for each  $u \in U$ , we have  $Z \subseteq N_H^f(u)$ .
6:     Let  $v$  be an arbitrary vertex in  $U$ .
7:      $X = X \setminus \{v\}$ .
8:   end while
9:    $q = q + 1$ .
10: end while
11: while  $|X| > n_{d+1}$  do
12:   Let  $v$  be an arbitrary vertex in  $X$ .
13:    $X = X \setminus \{v\}$ .
14: end while
15: Set  $X' = X$ .
16: return  $X'$ 

```

---

To prove the correctness of our algorithm, we state an observation, the proof of which follows from the fact that any vertex can have at most  $d$  forward neighbors in  $H$ .

► **Observation 1.** Let  $H$  be a  $d$ -degenerate graph and  $S$  be an independent set of  $H$  of size at most  $k$ . Then, for any set  $U \subseteq V(H)$ , such that for each vertex  $u \in U$ ,  $N_H^b(u) \cap S \neq \emptyset$ , we have that  $|U| \leq kd$ .

Now we are ready to prove the correctness of our algorithm (Algorithm 1) for  $d$ -BIP.

► **Lemma 2.** *Algorithm 1 is correct.*

**Proof.** Let  $(H, X, k)$  be an instance of  $d$ -BIP, and  $X'$  be the output returned by Algorithm 1 with it as the input. Clearly,  $X' \subseteq X$  as we do not add any new vertex to obtain the set  $X'$ ,

245 and size of  $X'$  is bounded by  $n_{d+1}$ , since at Step 10-13 of the algorithm we reduce its size  
 246 to (at most)  $n_{d+1}$ . Therefore, it remains to show that  $X'$  is a  $k$ -independence preserver of  
 247  $(H, X)$ . To this end, we consider the following cases.

248 **Case 1:**  $X$  is  $q$ -reducible, for each  $q \in [d]$ . In this case, the algorithm arbitrarily deletes  
 249 vertices (if required) from  $X$  to obtain  $X'$ . If  $X = X'$ , then the claim trivially holds.  
 250 Therefore, we assume that  $X'$  is a strict subset of  $X$ . To show that  $X'$  is a  $k$ -independence  
 251 preserver for  $(H, X)$ , consider an independent set  $S$  in  $H$  of size at most  $k$ . Furthermore,  
 252 consider a vertex  $v \in (S \cap X) \setminus X'$  (again, if such a vertex does not exist, the claim follows).  
 253 To prove the desired result, we want to find a replacement vertex for  $v$  in  $X'$  which can be  
 254 added to  $S$  (after removing  $v$ ) to obtain an independent set in  $H$ . To this end, we mark  
 255 some vertices in  $X'$ . Firstly, mark all the forward neighbors of each  $s \in S$  in the set  $X'$ .  
 256 That is, we let  $X'_M$  to be the set  $(\cup_{s \in S} N_H^f(s)) \cap X'$ . Also, we add all vertices in  $S \cap X'$   
 257 to the set  $X'_M$ . By the property of  $d$ -degeneracy sequence, we have that  $|X'_M| \leq kd + k$   
 258 (see Observation 1). Next, we will mark some more vertices in  $X'_M$  with the hope to find  
 259 a replacement vertex for  $v$  in  $X' \setminus X'_M$  to add to  $S$ . Recall that by our assumption  $X$  is  
 260  $q$ -reducible, for each  $q \in [d]$ , and in particular, it is  $d$ -reducible. Thus, for each  $s \in S$ , the  
 261 set  $X_s = \{x \in X \mid s \in N_H^f(x)\} \subseteq X$  has size at most  $n_d$ . Based on the above observation,  
 262 we describe our second level of marking of vertices in  $X'$ . For each  $s \in S$ , we add each  
 263 vertex in  $X_s$  to  $X'_M$ . From the discussions above, we have that  $|X'_M| \leq kd + k + kn_d$ . Since  
 264  $|X'| = n_{d+1}$ , and by definition,  $n_{d+1} = kn_d + kd + k + 1$ , we have  $X' \setminus X'_M \neq \emptyset$ . Moreover,  
 265 no vertex in  $X'$  has a neighbor in  $S \setminus \{v\}$ . Therefore, for  $v' \in X' \setminus X'_M$ , we have that  
 266  $S' = (S \setminus \{v\}) \cup \{v'\}$  is an independent set in  $H$ .

267 **Case 2:**  $X$  is not  $q$ -reducible, for some  $q \in [d]$ . Let  $q'$  be the smallest integer for which  
 268  $X$  is not  $q'$ -reducible. Since  $X$  is not  $q'$ -reducible, there is a set  $U \subseteq X$  of size at least  $n_q + 1$ ,  
 269 for which there is a set  $Z \subseteq V(H)$  of size exactly  $d - q + 1$ , such that for each  $u \in U$ , we  
 270 have  $Z \subseteq N_H^f(u)$ . Consider (first) such pair of sets  $U, Z$  considered by the algorithm in Step  
 271 4. Furthermore, let  $v \in U$  be the vertex deleted by the algorithm in Step 6. Let  $\hat{U} = U \setminus \{v\}$ .  
 272 To prove the claim, it is enough to show that for an independent set  $S$  of size at most  $k$   
 273 containing  $v$  in  $H$ , there is  $v' \in \hat{U}$  such that  $(S \setminus \{v\}) \cup \{v'\}$  is an independent set in  $H$ .  
 274 Here, we will use the fact that deleting a vertex from a set does not change a set from being  
 275  $\tilde{q}$ -reducible to a set which is not  $\tilde{q}$ -reducible, where  $\tilde{q} \in [d]$ . In the following, consider an  
 276 independent set  $S$  of size at most  $k$  containing  $v$  in  $H$ . We construct a marked set  $\hat{U}_M$ ,  
 277 of vertices in  $\hat{U}$ . Firstly, we add all the vertices in  $(\cup_{s \in S \setminus \{v\}} N_H^f(s)) \cap \hat{U}$  to  $\hat{U}_M$ . Also, we  
 278 add all vertices in  $S \cap \hat{U}$  to  $\hat{U}_M$ . Notice that at the end of above marking scheme, we have  
 279  $|\hat{U}_M| \leq kd + k$ . We will mark some more vertices in  $\hat{U}$ . Before stating the second level of  
 280 marking, we remark that  $S \cap Z = \emptyset$ . For each  $s \in S \setminus \{v\}$ , let  $Z_s = Z \cup \{s\}$ . Since  $S \cap Z = \emptyset$ ,  
 281 we have that  $|Z_s| = d - (q - 1) + 1$ . For  $s \in S \setminus \{v\}$ , let  $\hat{U}_s = \{u \in \hat{U} \mid Z_s \subseteq N_H^f(u)\}$ . Since  $X$   
 282 is  $q^*$ -reducible for each  $q^* < q'$ , we have  $|\hat{U}_s| \leq n_{q-1}$ , for each  $s \in S \setminus \{v\}$ . Now we are ready  
 283 to describe our second level of marking. For each  $s \in S \setminus \{v\}$ , add all vertices in  $\hat{U}_s$  to the set  
 284  $\hat{U}_M$ . Notice that  $|\hat{U}_M| \leq kd + k + kn_{q-1}$ . Moreover,  $|\hat{U}| \geq n_q$  and  $n_q = kn_{q-1} + kd + k + 1$ .  
 285 Thus, there is a vertex  $v' \in \hat{U} \setminus \hat{U}_M$ , such that  $(S \setminus \{v\}) \cup \{v'\}$  is an independent set in  $H$ . ◀

286 ► **Lemma 3.**  $(\star)^2$  Algorithm 1 runs in time  $n^{\mathcal{O}(d)}$ .

287 Using Lemma 2 and Lemma 3 we obtain the following theorem.

<sup>2</sup> The proofs of results marked with  $\star$  will appear in the full version of the paper.

288 ► **Theorem 4.**  $d$ -BOUNDED INDEPENDENCE PRESERVER admits an algorithm running in  
289 time  $n^{\mathcal{O}(d)}$ .

## 290 4 A Polynomial Kernel for $\mathcal{D}_d$ -CF-FVS

291 In this section, we design a kernelization algorithm for  $\mathcal{D}_d$ -CF-FVS.

292 To design a kernelization algorithm for  $\mathcal{D}_d$ -CF-FVS, we define another problem called  $\mathcal{D}_d$ -  
293 DISJOINT-CF-FVS ( $\mathcal{D}_d$ -DCF-FVS, for short). We first define the problem  $\mathcal{D}_d$ -DCF-FVS  
294 formally, and then explain its uses in our kernelization algorithm.

$\mathcal{D}_d$ -DISJOINT-CF-FVS ( $\mathcal{D}_d$ -DCF-FVS)

**Parameter:**  $k$

295 **Input:** An undirected graph  $G$ , a graph  $H \in \mathcal{D}_d$  such that  $V(G) = V(H)$ , a subset  
 $R \subseteq V(G)$ , and a non-negative integer  $k$ .

**Question:** Is there a set  $S \subseteq V(G) \setminus R$  of size at most  $k$ , such that  $G - S$  does not have  
any cycle and  $S$  is an independent set in  $H$ ?

296 Notice that  $\mathcal{D}_d$ -CF-FVS is a special case of  $\mathcal{D}_d$ -DCF-FVS, where  $R = \emptyset$ . Given an  
297 instance of  $\mathcal{D}_d$ -CF-FVS, the kernelization algorithm creates an instance of  $\mathcal{D}_d$ -DCF-FVS  
298 by setting  $R = \emptyset$ . Then it applies a kernelization algorithm for  $\mathcal{D}_d$ -DCF-FVS. Finally, the  
299 algorithm takes the instance returned by the kernelization algorithm for  $\mathcal{D}_d$ -DCF-FVS and  
300 generates an instance of  $\mathcal{D}_d$ -CF-FVS. Before moving forward, we note that the purpose  
301 of having set  $R$  is to be able to prohibit certain vertices to belong to a solution. This is  
302 particularly useful in maintaining the independent set property of the solution, when applying  
303 reduction rules which remove vertices from the graph (with an intention of it being in a  
304 solution).

305 We first focus on designing a kernelization algorithm for  $\mathcal{D}_d$ -DCF-FVS, and then give  
306 a polynomial time linear parameter preserving reduction from  $\mathcal{D}_d$ -DCF-FVS to  $\mathcal{D}_d$ -CF-  
307 FVS. If the kernelization algorithm for  $\mathcal{D}_d$ -DCF-FVS returns that  $(G, H, R, k)$  is a YES  
308 (NO) instance of  $\mathcal{D}_d$ -DCF-FVS, then conclude that  $(G, H, k)$  is a YES (NO) instance of  
309  $\mathcal{D}_d$ -CF-FVS. In the following, we describe a kernelization algorithm for  $\mathcal{D}_d$ -DCF-FVS. Let  
310  $(G, H, R, k)$  be an instance of  $\mathcal{D}_d$ -DCF-FVS. The algorithm starts by applying the following  
311 simple reduction rules.

312 ► **Reduction Rule 1.**

- 313 (a) If  $k \geq 0$  and  $G$  is acyclic, then return that  $(G, H, R, k)$  is a YES instance of  $\mathcal{D}_d$ -DCF-  
314 FVS.
- 315 (b) Return that  $(G, H, R, k)$  is a NO instance of  $\mathcal{D}_d$ -DCF-FVS, if one of the following  
316 conditions is satisfied:
- 317 (i)  $k \leq 0$  and  $G$  is not acyclic,
  - 318 (ii)  $G$  is not acyclic and  $V(G) \subseteq R$ , or
  - 319 (iii) There are more than  $k$  isolated cycles in  $G$ .

320 ► **Reduction Rule 2.**

- 321 (a) Let  $v$  be a vertex of degree at most 1 in  $G$ . Then delete  $v$  from the graphs  $G, H$  and the  
322 set  $R$ .
- 323 (b) If there is an edge in  $G$  ( $H$ ) with multiplicity more than 2 (more than 1), then reduce  
324 its multiplicity to 2 (1).
- 325 (c) If there is a vertex  $v$  with self loop in  $G$ . If  $v \notin R$ , delete  $v$  from the graphs  $G$  and  
326  $H$ , and decrease  $k$  by one. Furthermore, add all the vertices in  $N_H(v)$  to the set  $R$ ,  
327 otherwise return that  $(G, H, R, k)$  is a NO instance of  $\mathcal{D}_d$ -DCF-FVS.
- 328 (d) If there are parallel edges between (distinct) vertices  $u, v \in V(G)$  in  $G$ :

- 329 (i) If  $u, v \in R$ , then return that  $(G, H, R, k)$  is a NO instance of  $\mathcal{D}_d$ -DCF-FVS.  
 330 (ii) If  $u \in R$  ( $v \in R$ ), delete  $v$  ( $u$ ) from the graphs  $G$  and  $H$ , and decrease  $k$  by one.  
 331 Furthermore, add all the vertices in  $N_H(v)$  ( $N_H(u)$ ) to the set  $R$ .

332 It is easy to see that the above reduction rules are correct, and can be applied in  
 333 polynomial time. In the following, we define some notion and state some known results,  
 334 which will be helpful in designing our next reduction rules.

335 ► **Definition 4.** For a graph  $G$ , a vertex  $v \in V(G)$ , and an integer  $t \in \mathbb{N}$ , a  $t$ -flower at  $v$  is a  
 336 set of  $t$  vertex disjoint cycles whose pairwise intersection is exactly  $\{v\}$ .

337 ► **Proposition 1.** [8, 19, 25] For a graph  $G$ , a vertex  $v \in V(G)$  without a self-loop in  $G$ , and  
 338 an integer  $k$ , the following conditions hold.

- 339 (i) There is a polynomial time algorithm, which either outputs a  $(k+1)$ -flower at  $v$ , or it  
 340 correctly concludes that no such  $(k+1)$ -flower exists. Moreover, if there is no  $(k+1)$ -flower  
 341 at  $v$ , it outputs a set  $X_v \subseteq V(G) \setminus \{v\}$  of size at most  $2k$ , such that  $X_v$  intersects every  
 342 cycle passing through  $v$  in  $G$ .  
 343 (ii) If there is no  $(k+1)$ -flower at  $v$  in  $G$  and the degree of  $v$  is at least  $4k + (k+2)2k$ .  
 344 Then using a polynomial time algorithm we can obtain a set  $X_v \subseteq V(G) \setminus \{v\}$  and a  
 345 set  $\mathcal{C}_v$  of components of  $G[V(G) \setminus (X_v \cup \{v\})]$ , such that each component in  $\mathcal{C}_v$  is a tree,  
 346  $v$  has exactly one neighbor in  $C \in \mathcal{C}_v$ , and there exist at least  $k+2$  components in  $\mathcal{C}_v$   
 347 corresponding to each vertex  $x \in X_v$  such that these components are pairwise disjoint  
 348 and vertices in  $X_v$  have an edge to each of their associated components.

349 ► **Reduction Rule 3.** Consider  $v \in V(G)$ , such that there is a  $(k+1)$ -flower at  $v$  in  $G$ . If  
 350  $v \in R$ , then return that  $(G, H, R, k)$  is a NO instance of  $\mathcal{D}_d$ -DCF-FVS. Otherwise, delete  $v$   
 351 from  $G, H$  and decrease  $k$  by one. Furthermore, add all the vertices in  $N_H(v)$  to  $R$ .

352 The correctness of the above reduction rule follows from the fact that such a vertex must  
 353 be part of every solution of size at most  $k$ . Moreover, the applicability of it in polynomial  
 354 time follows from Proposition 1 (item (i)).

355 ► **Reduction Rule 4.** Let  $v \in V(G)$ ,  $X_v \subseteq V(G) \setminus \{v\}$ , and  $\mathcal{C}_v$  be the set of components  
 356 which satisfy the conditions in Proposition 1(ii) (in  $G$ ), then delete edges between  $v$  and the  
 357 components of the set  $\mathcal{C}_v$ , and add parallel edges between  $v$  and every vertex  $x \in X_v$  in  $G$ .

358 The polynomial time applicability of Reduction Rule 4 follows from Proposition 1. And,  
 359 in the following lemma, we prove the safeness of this reduction rule.

360 ► **Lemma 5.** ( $\star$ ) *Reduction Rule 4 is safe.*

361 In the following, we state an easy observation, which follows from non-applicability of  
 362 Reduction Rule 1 to 4.

363 ► **Observation 6.** Let  $(G, H, R, k)$  be an instance of  $\mathcal{D}_d$ -DCF-FVS, where none of Reduction  
 364 Rule 1 to 4 apply. Then the degree of each vertex in  $G$  is bounded by  $\mathcal{O}(k^2)$ .

365 **Proof.** As Reduction Rule 3 is not applicable, then there is no  $k+1$ -flower in  $G$ . Now, if  
 366 there is  $v \in V(G)$  with degree at least  $4k + (k+2)2k$ , then Reduction Rule 4 would be  
 367 applicable. ◀

368 To design our next reduction rule, we construct an auxiliary graph  $G^*$ . Intuitively  
 369 speaking,  $G^*$  is obtained from  $G$  by shortcutting all degree two vertices. That is, vertex  
 370 set of  $G^*$  comprises of all the vertices of degree at least three in  $G$ . From now on, vertices  
 371 of degree at least 3 (in  $G$ ) will be referred to as high degree vertices. For each  $uv \in E(G)$ ,

## 14:10 Exploring the Kernelization Borders for Hitting Cycles

where  $u, v$  are high degree vertices, we add the edge  $uv$  in  $G^*$ . Furthermore, for an induced maximal path  $P_{uv}$ , between  $u$  and  $v$  where all the internal vertices of  $P_{uv}$  are degree two vertices in  $G$ , we add the (multi) edge  $uv$  to  $E(G^*)$ . Next, we will use the following result to bound the number of vertices and edges in  $G^*$ .

► **Proposition 2.** [8] A graph  $G$  with minimum degree at least 3, maximum degree  $\Delta$ , and a feedback vertex set of size at most  $k$  has at most  $(\Delta + 1)k$  vertices and  $2\Delta k$  edges.

The above result (together with the construction of  $G^*$ ) gives us the following (safe) reduction rule.

► **Reduction Rule 5.** If  $|V(G^*)| \geq 4k^2 + 2k^2(k + 2)$  or  $|E(G^*)| \geq 8k^2 + 4k^2(k + 2)$ , then return NO.

► **Lemma 7.** Let  $(G, H, R, k)$  be an instance of  $\mathcal{D}_d$ -DCF-FVS, where none of the Reduction Rules 1 to 5 are applicable. Then we obtain the following bounds:

- The number of vertices of degree at least 3 in  $G$  is bounded by  $\mathcal{O}(k^3)$ .
- The number of maximal degree two induced paths in  $G$  is bounded by  $\mathcal{O}(k^3)$ .

Having shown the above bounds, it remains to bound the number of degree two vertices in  $G$ . We start by applying the following simple reduction rule to eliminate vertices of degree two in  $G$ , which are also in  $R$ .

► **Reduction Rule 6.** Let  $v \in R$ ,  $d_G(v) = 2$ , and  $x, y$  be the neighbors of  $v$  in  $G$ . Delete  $v$  from the graphs  $G, H$  and the set  $R$ . Furthermore, add the edge  $xy$  in  $G$ .

The correctness of this reduction rule follows from the fact that vertices in  $R$  can not be part of any solution and all the cycles passing through  $v$  also passes through its neighbors.

In the polynomial kernel for the FEEDBACK VERTEX SET problem (with no conflict constraints), we can short-circuit degree two vertices. But in our case, we cannot perform this operation, since we also need the solution to be an independent set in the conflict graph. Thus to reduce the number of degree two vertices in  $G$ , we exploit the properties of a  $d$ -degenerate graph. To this end, we use the tool that we developed in Section 3. This immediately gives us the following reduction rule.

► **Reduction Rule 7.** Let  $P$  be a maximal degree two induced path in  $G$ . If  $|V(P)| \geq n_{d+1} + 1$ , apply Algorithm 1 with input  $(H, V(P) \setminus R)$ . Let  $\widehat{V}(P)$  be the set returned by Algorithm 1. Let  $v \in (V(P) \setminus R) \setminus \widehat{V}(P)$ , and  $x, y$  be the neighbors of  $v$  in  $G$ . Delete  $v$  from the graphs  $G, H$ . Furthermore, add edge  $xy$  in  $G$ .

► **Lemma 8.** Reduction Rule 7 is safe.

**Proof.** Let  $(G, H, R, k)$  be an instance of  $\mathcal{D}_d$ -DCF-FVS and  $v$  be a vertex in a maximal degree two path  $P$  with neighbors  $x$  and  $y$ , with respect to which Reduction Rule 8 is applied. Furthermore, let  $(G', H', R, k)$  be the resulting instance after application of the reduction rule. We will show that  $(G, H, R, k)$  is a YES instance of  $\mathcal{D}_d$ -DCF-FVS if and only if  $(G', H', R, k)$  is a YES instance of  $\mathcal{D}_d$ -DCF-FVS.

In the forward direction, let  $(G, H, R, k)$  be a YES instance of  $\mathcal{D}_d$ -DCF-FVS and  $S$  be one of its minimal solution. Consider the case when  $v \notin S$ . In this case, we claim that  $S$  is also a solution of  $\mathcal{D}_d$ -DCF-FVS for  $(G', H', R, k)$ . Suppose not then either  $S$  is not an independent set in  $H'$  or  $G' - S$  contains a cycle. Since,  $H'$  is an induced subgraph of  $H$ , we have that  $S'$  is also an independent set in  $H'$ . So we assume that  $G' - S$  has a cycle, say  $C$ . If  $C$  does not contain the edge  $xy$ , then  $C$  is also a cycle in  $G - S$ . Therefore, we assume that  $C$  contains the edge  $xy$ . But then  $(C \setminus \{xy\}) \cup \{xv, vy\}$  is a cycle in  $G - S$ . Next, we consider the case when  $v \in S$ . By Lemma 2 we have a vertex  $v' \in V(P) \setminus \{v\}$  such that

417  $(S \setminus \{v\}) \cup \{v'\}$  is an independent set in  $H'$ . By using the fact that any cycle that passes  
 418 through  $v$  also contains all vertices in  $P$  (together with the discussions above) imply that  
 419  $(S \setminus \{v\}) \cup \{v'\}$  is a solution of  $\mathcal{D}_d$ -DCF-FVS for  $(G', H', R, k)$ .

420 In the reverse direction, let  $(G', H', R, k)$  be a YES instance of  $\mathcal{D}_d$ -DCF-FVS and  $S'$   
 421 be one of its minimal solution. We claim that  $S'$  is also a solution of  $\mathcal{D}_d$ -DCF-FVS for  
 422  $(G, H, R, k)$ . Suppose not, then either  $S$  is not an independent set in  $H$  or  $G - S$  contains a  
 423 cycle. Since,  $H'$  is an induced subgraph of  $H$ , we have that  $S'$  is also an independent set in  $H$ .  
 424 Next, assume that there is a cycle  $C$  in  $G - S$ . The cycle  $C$  must contain  $v$ , otherwise,  $C$  is  
 425 also a cycle in  $G' - S'$ . Since  $v$  is a degree two vertex in  $G$ , therefore any cycle that contains  
 426  $v$ , must also contain  $x$  and  $y$ . As observed before,  $G - \{xv, vy\}$  is identical to  $G' - \{xy\}$ .  
 427 But then,  $(C \setminus \{xv, vy\}) \cup \{xy\}$  is a cycle in  $G' - S'$ , a contradiction. This concludes that  $S'$   
 428 is a solution of  $\mathcal{D}_d$ -DCF-FVS for  $(G, H, R, k)$ . ◀

429 ▶ **Lemma 9.** ( $\star$ ) *Let  $(G, H, R, k)$  be an instance of  $\mathcal{D}_d$ -DCF-FVS, where none of the*  
 430 *Reduction Rules 1 to 7 are applicable. Then the number of vertices in a degree two induced*  
 431 *path in  $G$  is bounded by  $\mathcal{O}(k^{\mathcal{O}(d)})$ .*

432 ▶ **Theorem 10.**  *$\mathcal{D}_d$ -DCF-FVS admits a kernel with  $\mathcal{O}(k^{\mathcal{O}(d)})$  vertices.*

433 ▶ **Lemma 11.** ( $\star$ ) *There is a polynomial time parameter preserving reduction from  $\mathcal{D}_d$ -DCF-*  
 434 *FVS to  $\mathcal{D}_d$ -CF-FVS.*

435 By Theorem 10 and Lemma 11, we obtain the following result.

436 ▶ **Theorem 12.**  *$\mathcal{D}_d$ -CF-FVS admits a kernel with  $\mathcal{O}(k^{\mathcal{O}(d)})$  vertices.*

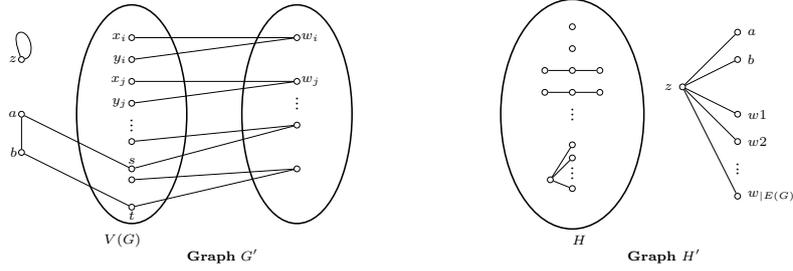

## 437 5 Kernelization Complexity of $\mathcal{P}_{\leq 3}^{**}$ -CF-OCT

438 In this section, we show that CF-OCT does not admit a polynomial kernel when the conflict  
 439 graph belongs to the family  $\mathcal{P}_{\leq 3}^{**}$ . Let  $\mathcal{P}_{\leq 3}$  denotes the family of disjoint union of paths of  
 440 length at most three, and  $\mathcal{P}_{\leq 3}^*$  denotes the family of disjoint union of paths of length at most  
 441 three and a star graph. We give parameter preserving reduction from  $\mathcal{P}_{\leq 3}^*$ -CONFLICT FREE  
 442  $s$ - $t$  CUT ( $\mathcal{P}_{\leq 3}^*$ -CF- $s$ - $t$  CUT) to  $\mathcal{P}_{\leq 3}^{**}$ -CF-OCT.

443 We first prove that  $\mathcal{P}_{\leq 3}^*$ -CF- $s$ - $t$  CUT is NP-hard. Then, we prove that  $\mathcal{P}_{\leq 3}^*$ -CF- $s$ - $t$   
 444 CUT does not admit a polynomial compression, unless  $\text{NP} \subseteq \frac{\text{coNP}}{\text{poly}}$  using the method of  
 445 cross-composition.

446 ▶ **Theorem 13** ( $\star$ ).  *$\mathcal{P}_{\leq 3}^*$ -CF- $s$ - $t$  CUT does not admit a polynomial compression unless*  
 447  *$\text{NP} \subseteq \frac{\text{coNP}}{\text{poly}}$ .*

448 **Lower Bound for Kernel of  $\mathcal{P}_{\leq 3}^{**}$ -CF-OCT.** In this subsection, we prove the main  
 449 result of this section. We show that there does not exist a polynomial kernel of  $\mathcal{P}_{\leq 3}^{**}$ -  
 450 CF-OCT. Towards this we give a parameter preserving reduction from  $\mathcal{P}_{\leq 3}^*$ -CF- $s$ - $t$  CUT  
 451 to  $\mathcal{P}_{\leq 3}^{**}$ -CF-OCT. Given an instance  $(G, H, s, t, k)$  of  $\mathcal{P}_{\leq 3}^*$ -CF- $s$ - $t$  CUT, we construct an  
 452 instance  $(G', H', k + 1)$  of  $\mathcal{P}_{\leq 3}^{**}$ -CF-OCT as follows. Initially, we have  $V(G') = V(H') =$   
 453  $V(G) \cup \{z, a, b\}$ . Now, for each edge  $e_i \in E(G)$ , add a vertex  $w_i$  to  $V(G')$  and  $V(H')$ . Now,  
 454 we define the edge set of  $G'$ . Let  $x_i, y_i$  be end points of  $e_i \in E(G)$ . For each  $e_i \in E(G)$ , add  
 455 edges  $x_i w_i$  and  $y_i w_i$  to  $E(G')$ . Also, add a self loop on  $z$  in  $G'$  and edges  $sa, ab$  and  $bt$  to  
 456  $E(G')$ . To construct the edge set of  $H'$ , we set  $E(H') = E(H - \{s, t\})$ . Additionally, we add  
 457  $zs, zt, za, zt$ , and  $zw_i$  for each  $w_i \in V(H')$  to  $E(H')$ . Figure 1 describes the construction of  
 458  $G'$  and  $H'$ .

■ **Figure 1** An illustration of construction of graph  $G'$  and  $H'$  in reduction from  $\mathcal{P}_{\leq 3}^*$ -CF- $s-t$  CUT to  $\mathcal{P}_{\leq 3}^{**}$ -CF-OCT.

459 Clearly,  $H'$  belongs to  $\mathcal{P}_3^{**}$  and this construction can be carried out in the polynomial  
 460 time. Now, we prove the equivalence between the instances  $(G, H, s, t, k)$  of  $\mathcal{P}_{\leq 3}^*$ -CF- $s-t$   
 461 CUT and  $(G', H', k + 1)$  of  $\mathcal{P}_{\leq 3}^{**}$ -CF-OCT in the following lemma.

462 ► **Lemma 14.**  $(G, H, s, t, k)$  is a yes-instance of  $\mathcal{P}_{\leq 3}^*$ -CF- $s-t$  CUT if and only if  $(G', H', k + 1)$   
 463 is a yes-instance of  $\mathcal{P}_{\leq 3}^{**}$ -CF-OCT.

464 **Proof.** In the forward direction, let  $(G, H, s, t, k)$  be a yes-instance of  $\mathcal{P}_{\leq 3}^*$ -CF- $s-t$  CUT  
 465 and  $S$  be one of its solution. We claim that  $S \cup \{z\}$  is a solution to  $\mathcal{P}_{\leq 3}^{**}$ -CF-OCT in  
 466  $(G', H', k + 1)$ . In the graph  $G'$ , since we subdivide each edge, all the paths from  $s - t$  are of  
 467 even length. Since, we subdivide each edge of  $G$ ,  $G' - \{a, b, z\}$  is a bipartite graph. Hence,  
 468 an odd cycle in  $G' - z$  consists of an  $s - t$  path in  $G' - \{a, b\}$  and edges  $sa$ ,  $ab$  and  $bt$ . Clearly,  
 469 by the construction of  $G'$ ,  $(G' - \{a, b\}) \setminus S$  does not contain an  $s - t$  path and hence  $G' - z$   
 470 does not contain an odd cycle. Since,  $H[S]$  is edgeless,  $S \cup \{z\}$  is an independent set in  $H'$ .  
 471 This completes the proof in the forward direction.

472 In the reverse direction, let  $S$  be a solution to  $\mathcal{P}_{\leq 3}^{**}$ -CF-OCT in  $(G', H', k + 1)$ . Since,  
 473  $z \in S$ , therefore,  $s, t, a, b, w_i \notin S$  for any  $w_i \in V(H')$ . We claim that  $S' = S \setminus \{z\}$   
 474 is a solution to  $\mathcal{P}_{\leq 3}^*$ -CF- $s-t$  CUT in  $(G, H, s, t, k)$ . Suppose not, then there exists a  
 475  $s - t$  path  $(s, x_1, x_2, \dots, x_l, t)$  in  $G \setminus S'$ . Correspondingly, there exists a  $s - t$  path  
 476  $(s, w_1, x_1, w_2, x_2, \dots, x_l, w_{l+1}, t)$  in  $G'$  of even length which results into an odd cycle  
 477  $(s, w_1, x_1, w_2, x_2, \dots, x_l, w_{l+1}, t, b, a)$  in  $G' \setminus S$ , a contradiction. This completes the proof.  
 478 ◀

479 Now, we present the main result of this section in the following theorem.

480 ► **Theorem 15.**  $\mathcal{P}_{\leq 3}^{**}$ -CF-OCT does not admit a polynomial kernel, unless  $\text{NP} \subseteq \frac{\text{coNP}}{\text{poly}}$ .

## 481 6 Conclusion

482 In this paper we studied kernelization complexity of  $\mathcal{D}_d$ -CF-FVS and  $\mathcal{D}_d$ -CF-OCT. We  
 483 showed that the former admits a polynomial kernel of size  $k^{\mathcal{O}(d)}$ , while  $\mathcal{D}_d$ -CF-OCT does not  
 484 admit any polynomial kernel unless  $\text{NP} \subseteq \frac{\text{coNP}}{\text{poly}}$ . In fact, the later does not admit polynomial  
 485 kernel even for much more specialized problem, namely  $\mathcal{P}_{\leq 3}^{**}$ -CF-OCT. Using much more  
 486 involved marking scheme we can show that  $\mathcal{D}_d$ -CF-ECT admits polynomial kernel of size  
 487  $k^{\mathcal{O}(d)}$ . Similarly, we can extend the known polynomial kernel for OCT to CF-OCT when  
 488 the conflict graph  $H$  has maximum degree at most one. Two most interesting questions that  
 489 still remain open from our work are following: (a) does CF-FVS admit uniform polynomial  
 490 kernel on graphs of bounded expansion; and (b) does CF-OCT admit a polynomial kernel  
 491 when  $H$  is disjoint union of paths of length at most 2.
